Blue Horizontal Branch Stars

Stellar Color Locus

- Stars lie on a ribbon-like surface in color space.
- SDSS (u,g,r)

Stellar Color Locus

- Stars lie on a ribbon-like surface in color space.
 - SDSS (u,g,r)
 - PS1 (g,r,i)

Surface Gravity Splits A Giants and Dwarfs in Color

- $u-g$ is a good separator because of the Balmer Break

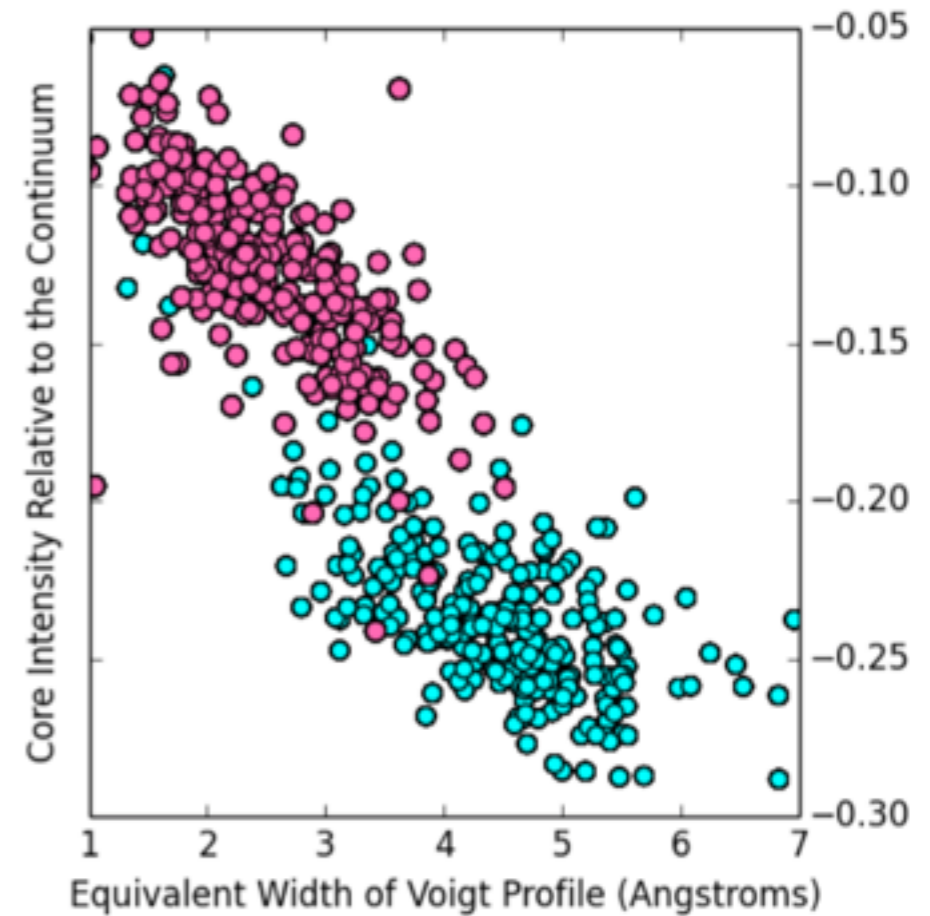

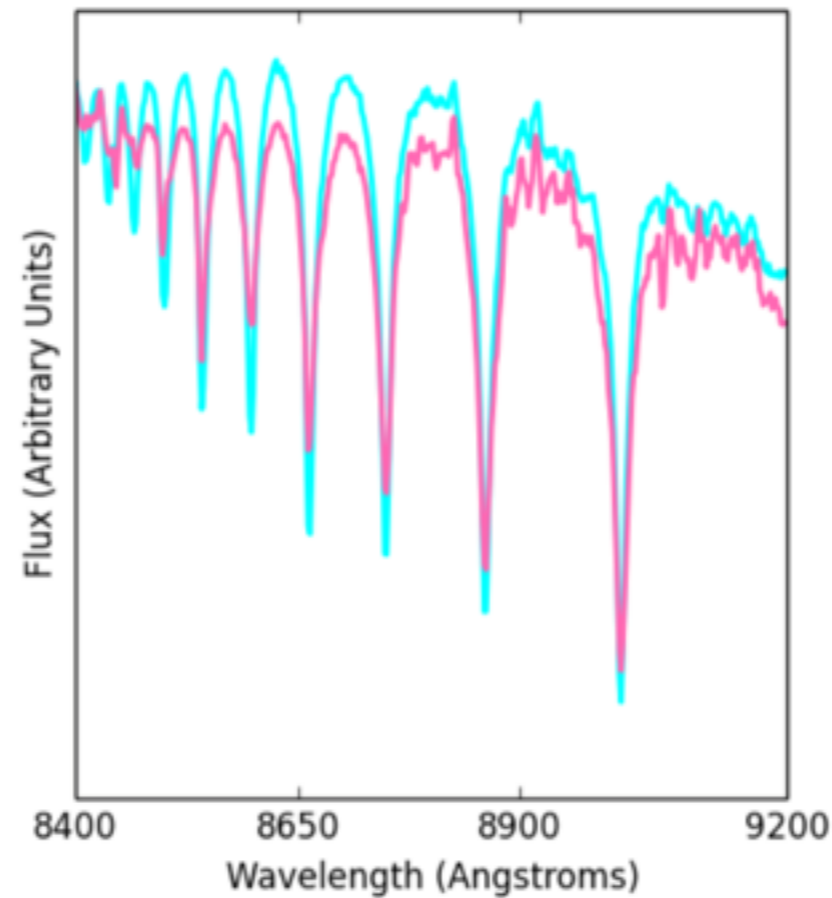

Surface Gravity Splits A Giants and Dwarfs in Color

- u_{SDSS} is a good separator because of the Balmer break
- z_{PS1} is a good separator because of the Paschen break

Visual of the Paschen Break

Vickers+ 2012

$$\frac{1}{\lambda_{\text{vac}}} = R \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right)$$

Pan-STARRS Data

- 1.8 meter Ritchey-Chretien Reflector
- 1.4 Gpx Camera
- 3° Field of View
- Six Photometric Filters
- Time Resolved

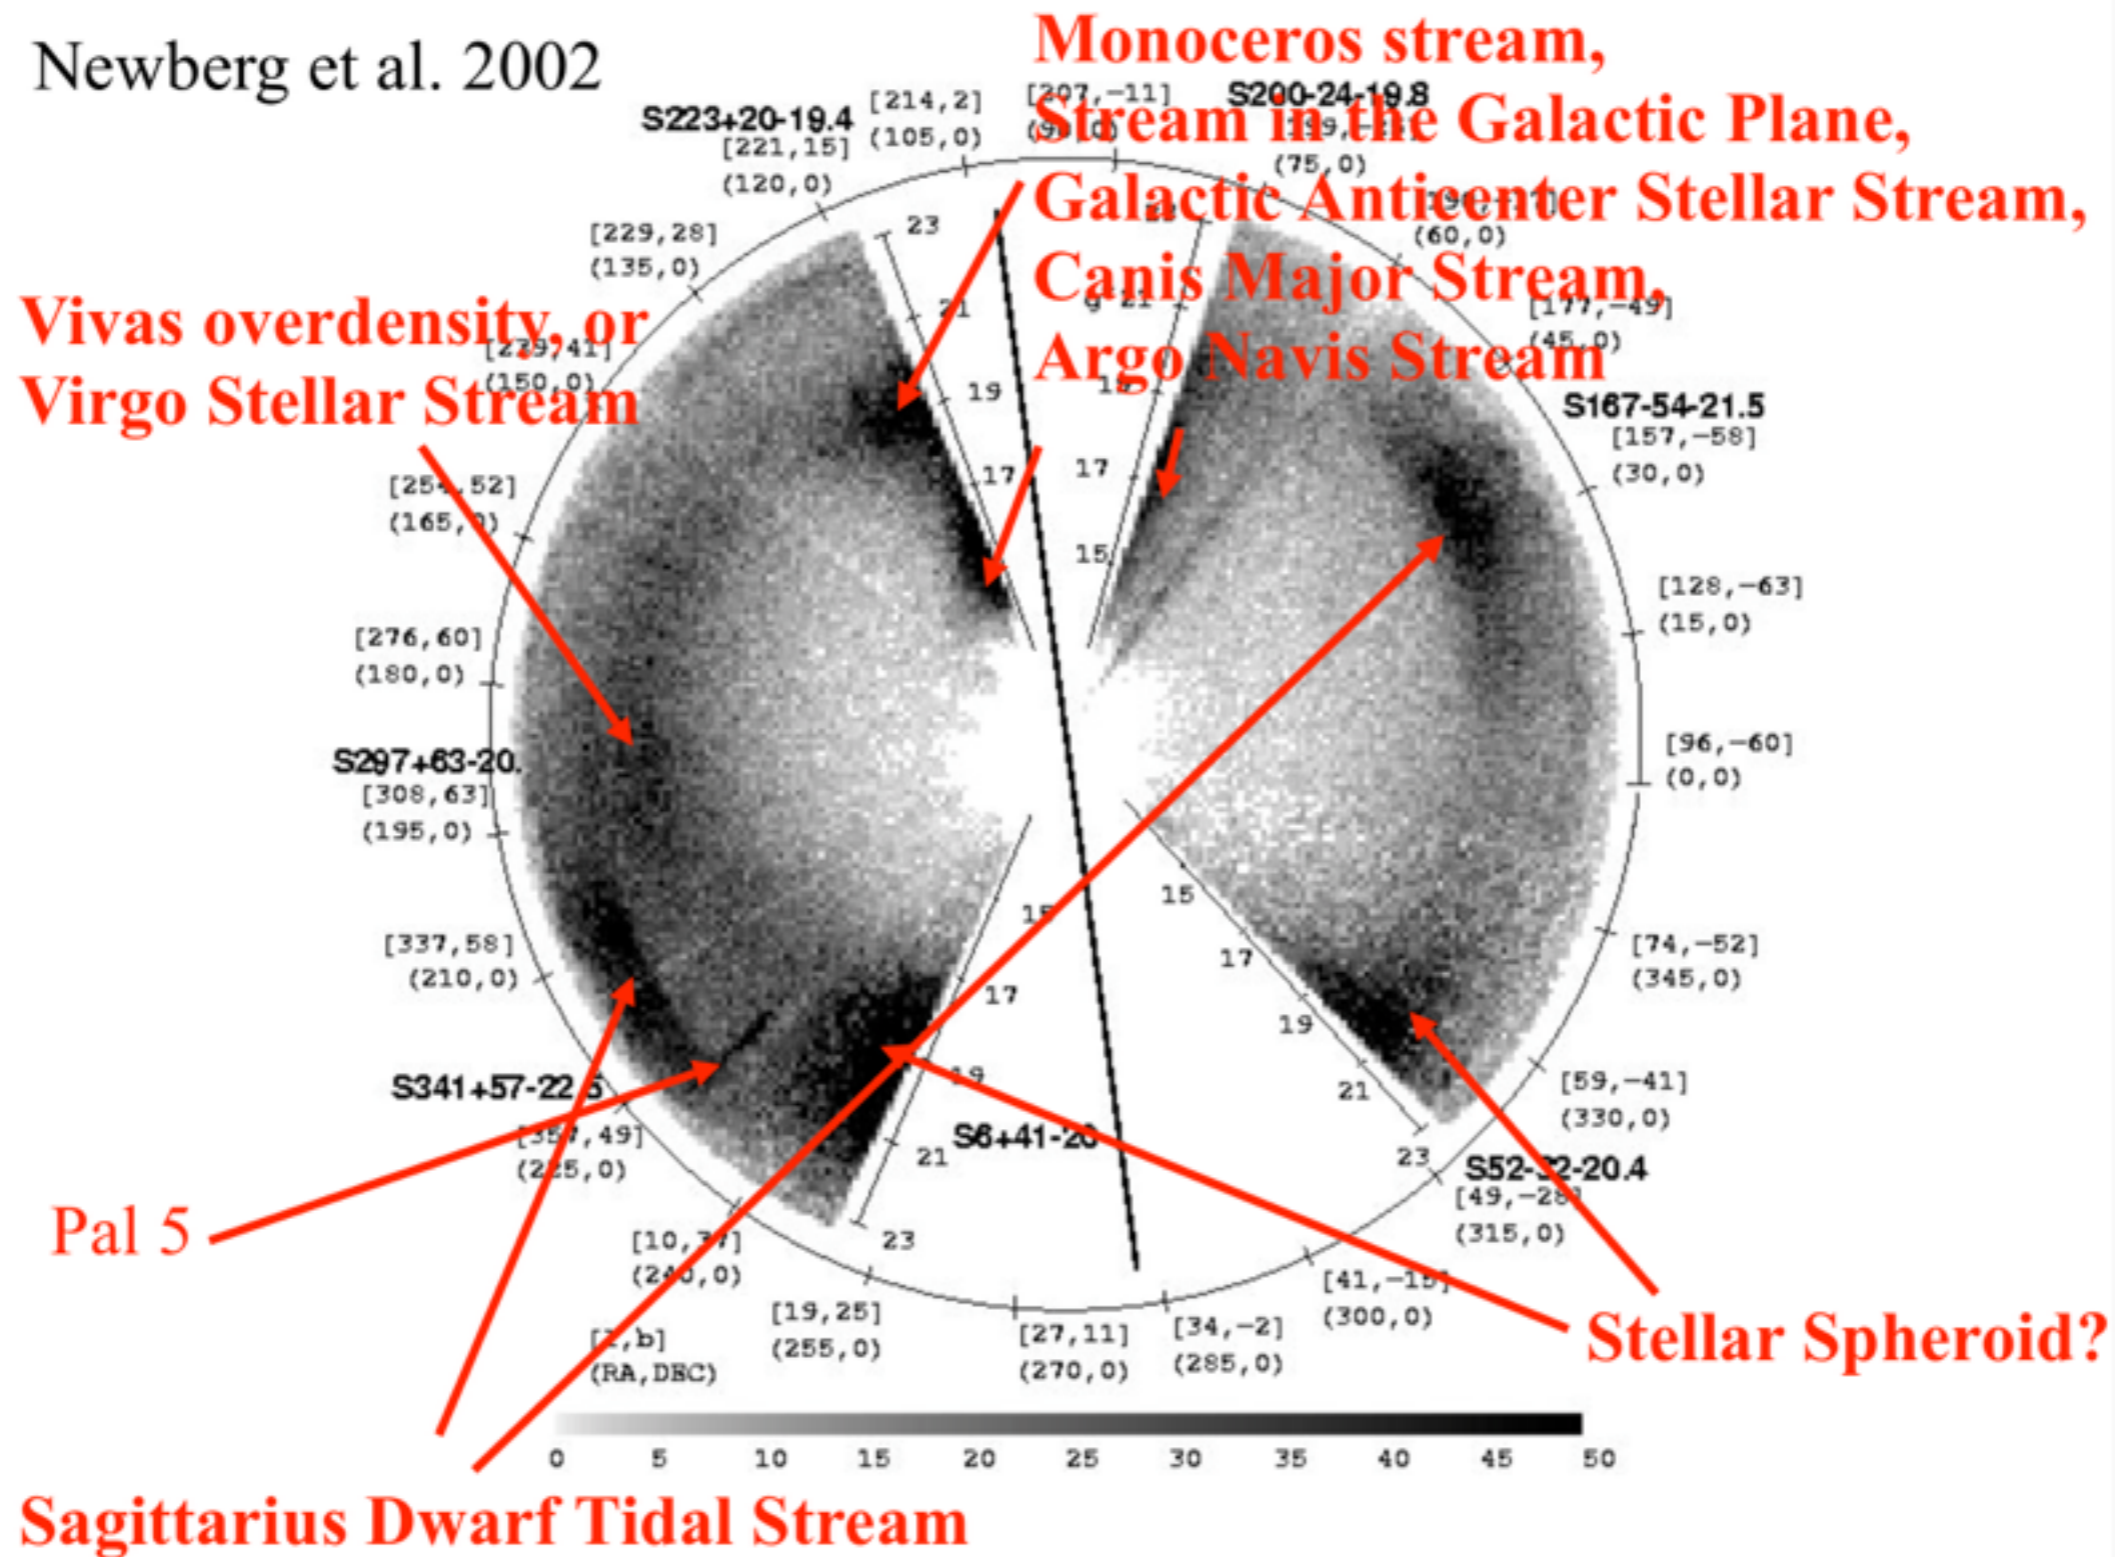

Substructure in the Halo

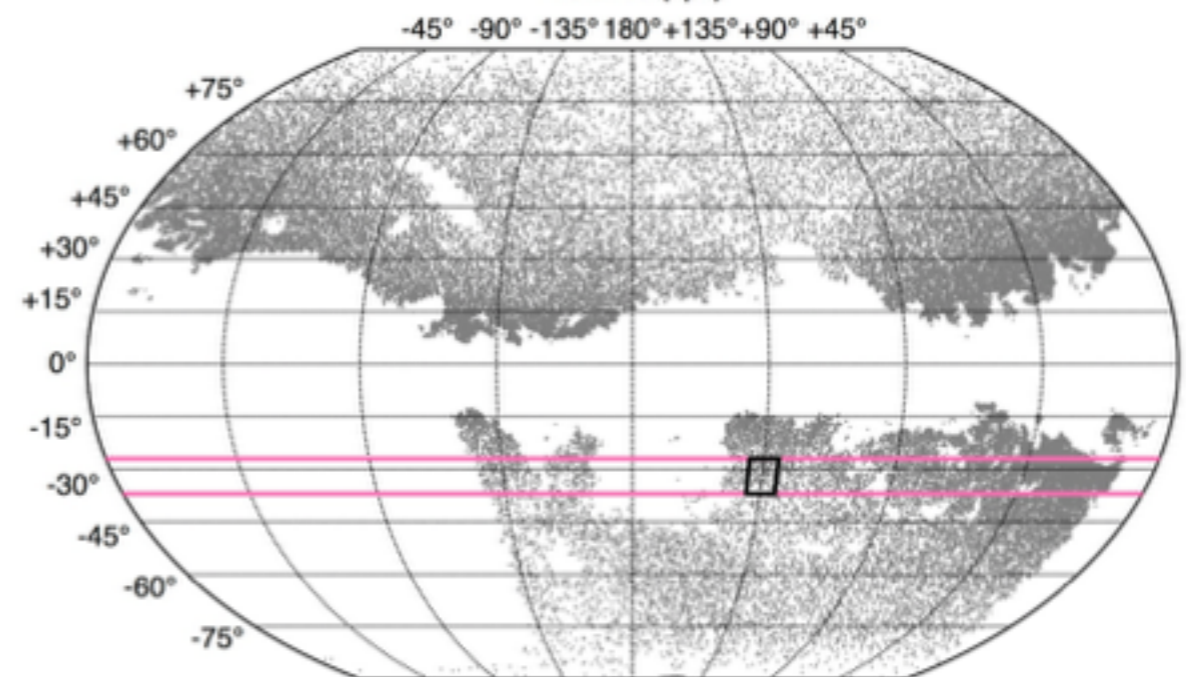

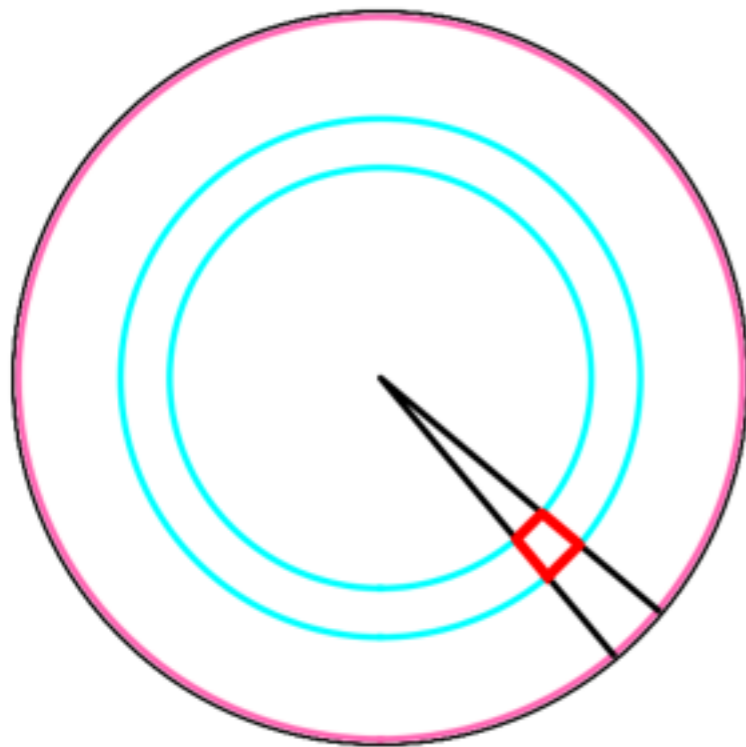

Substructure in the Halo

Newberg et al. 2002

Search Strategy for Pan-STARRS

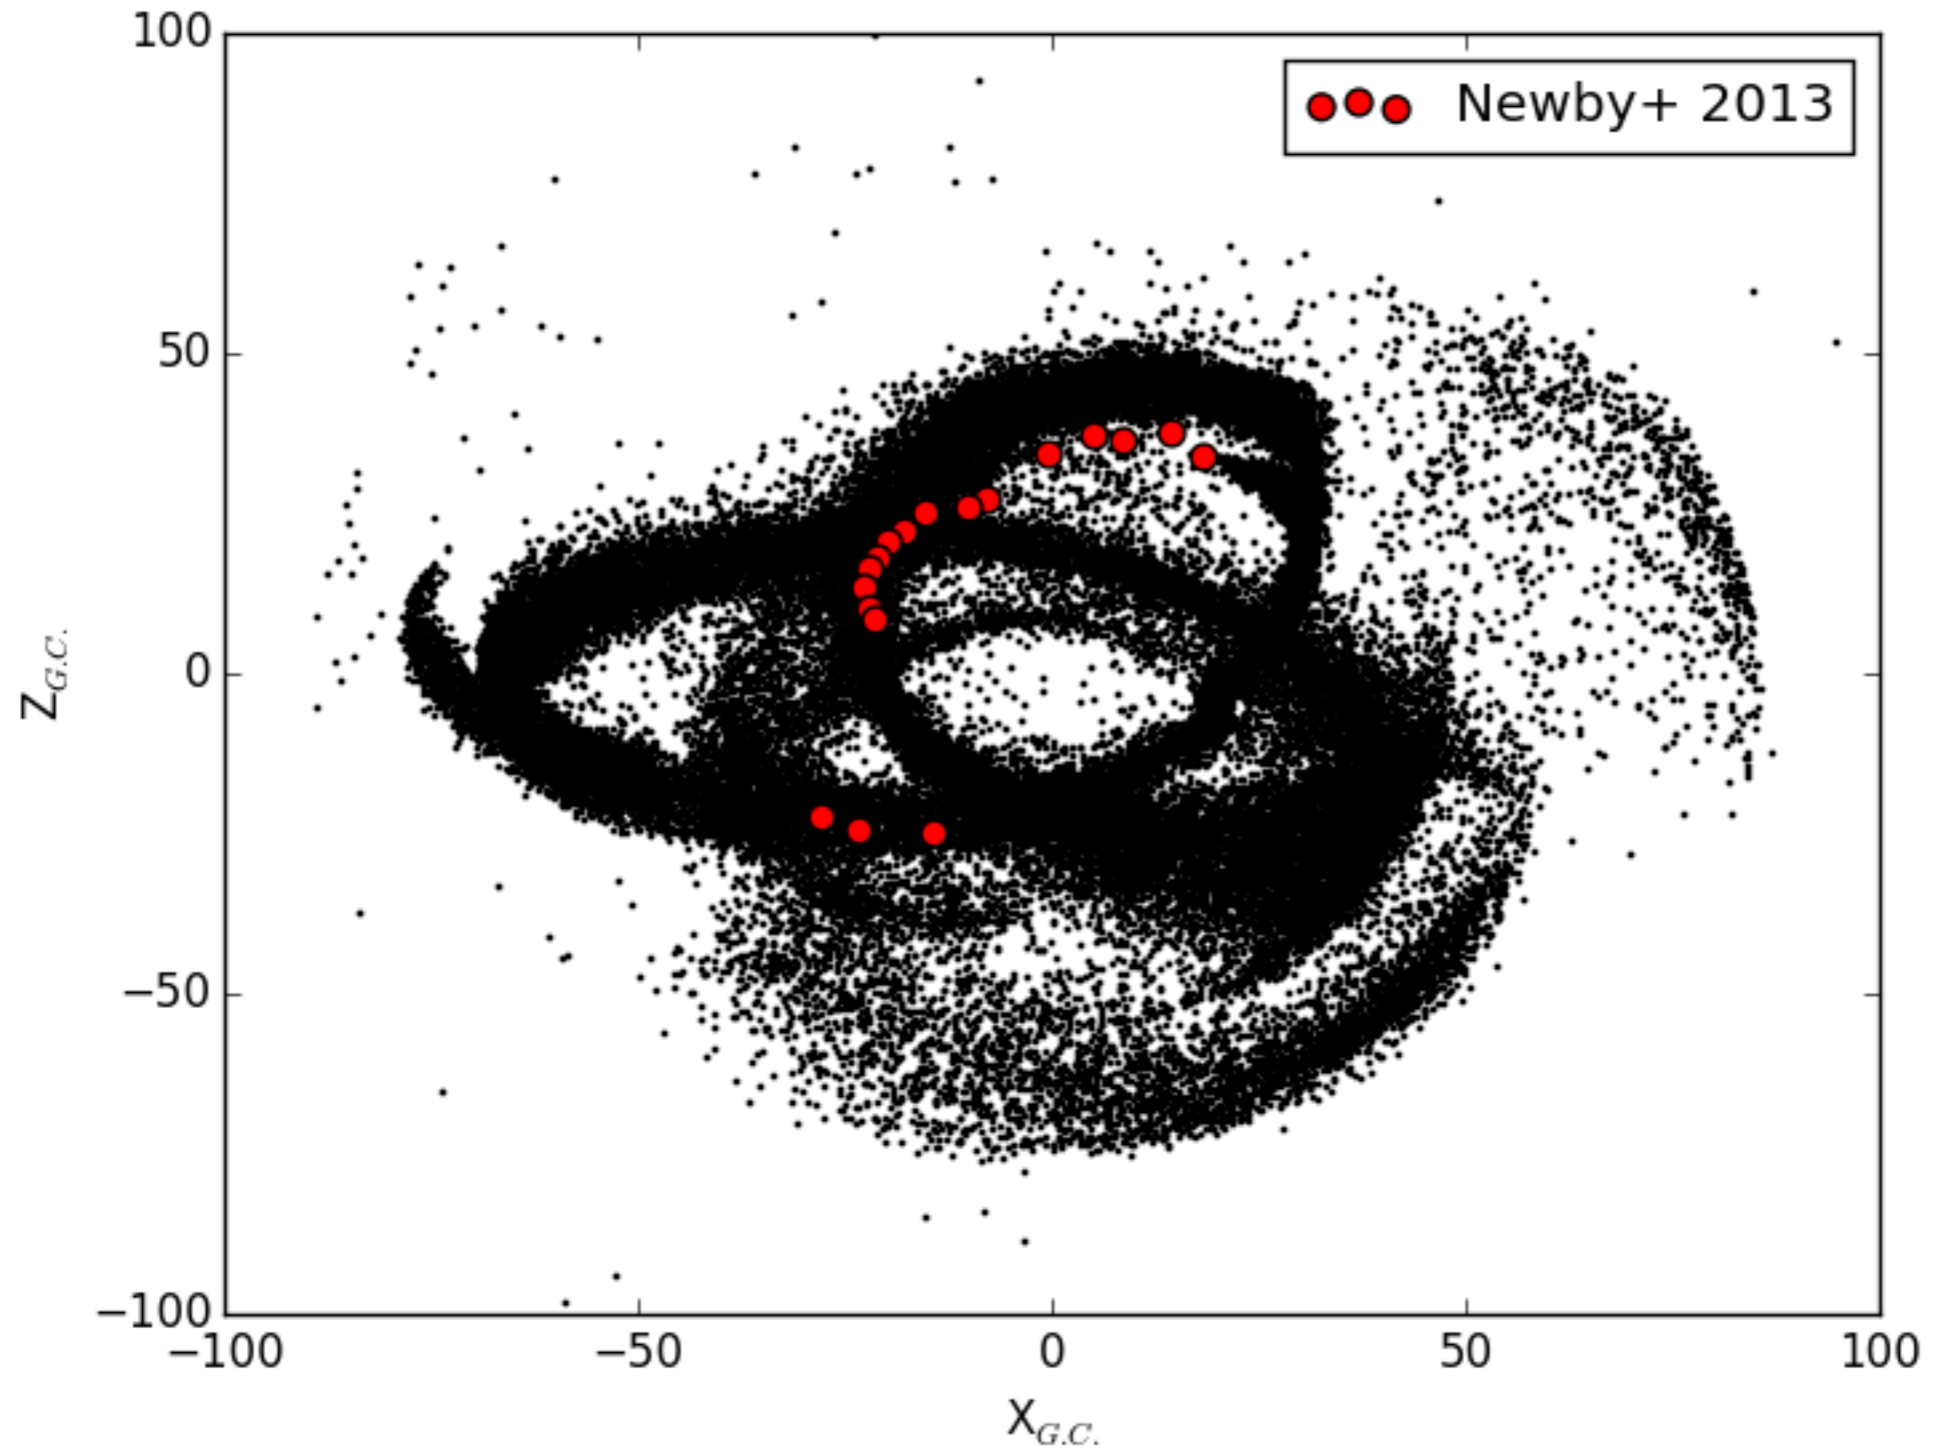

- Compare ratio of stars at a certain distance in a pencil beam to the ratio of stars at that distance in a ring at the same latitude.

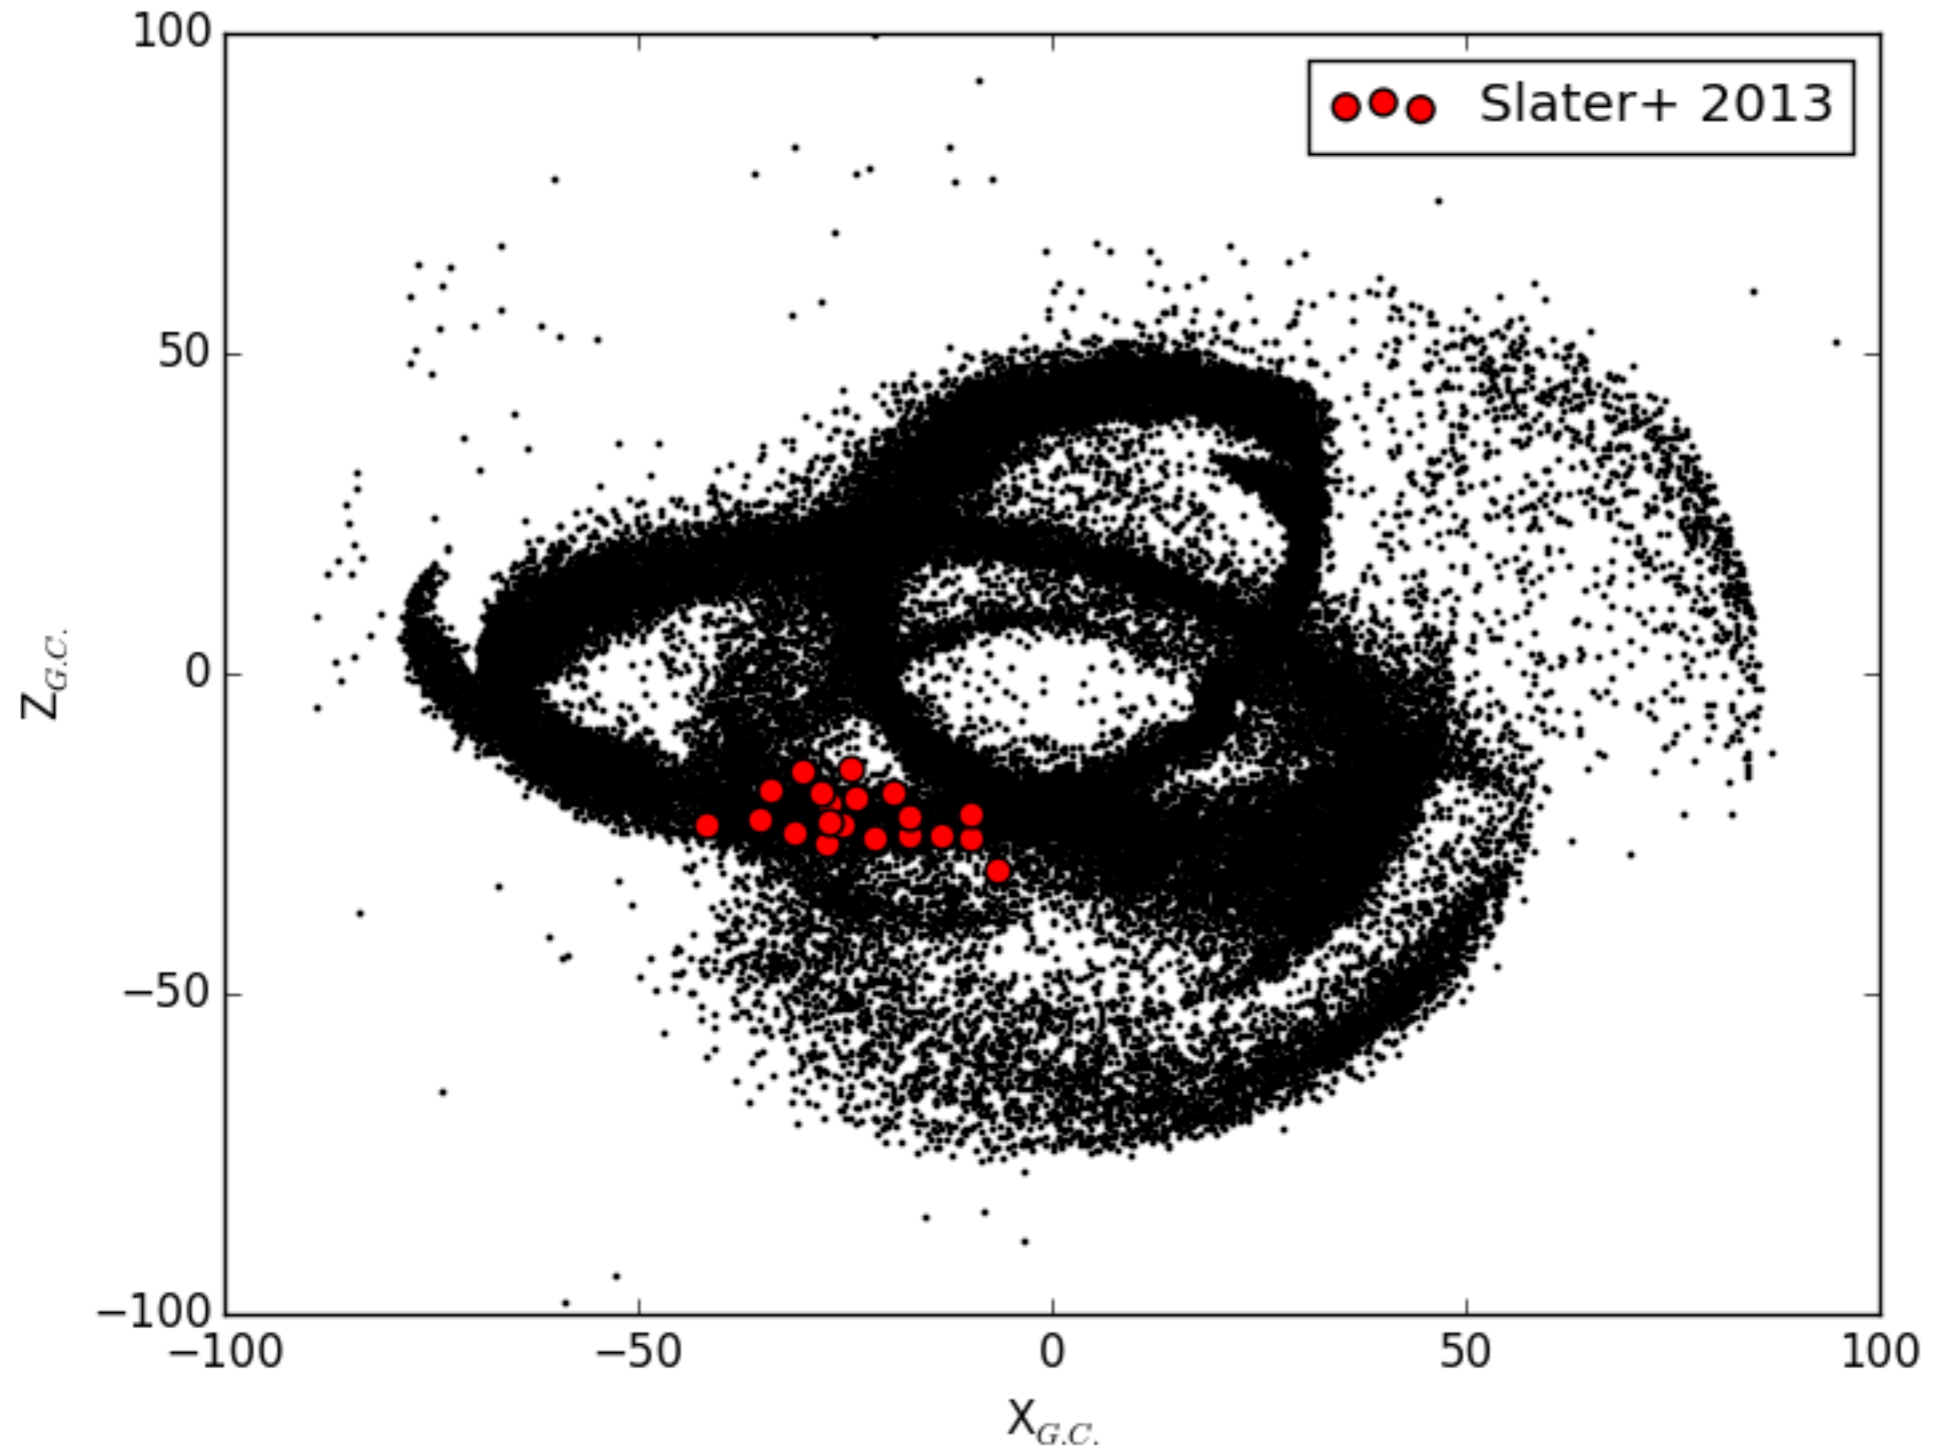

Findings

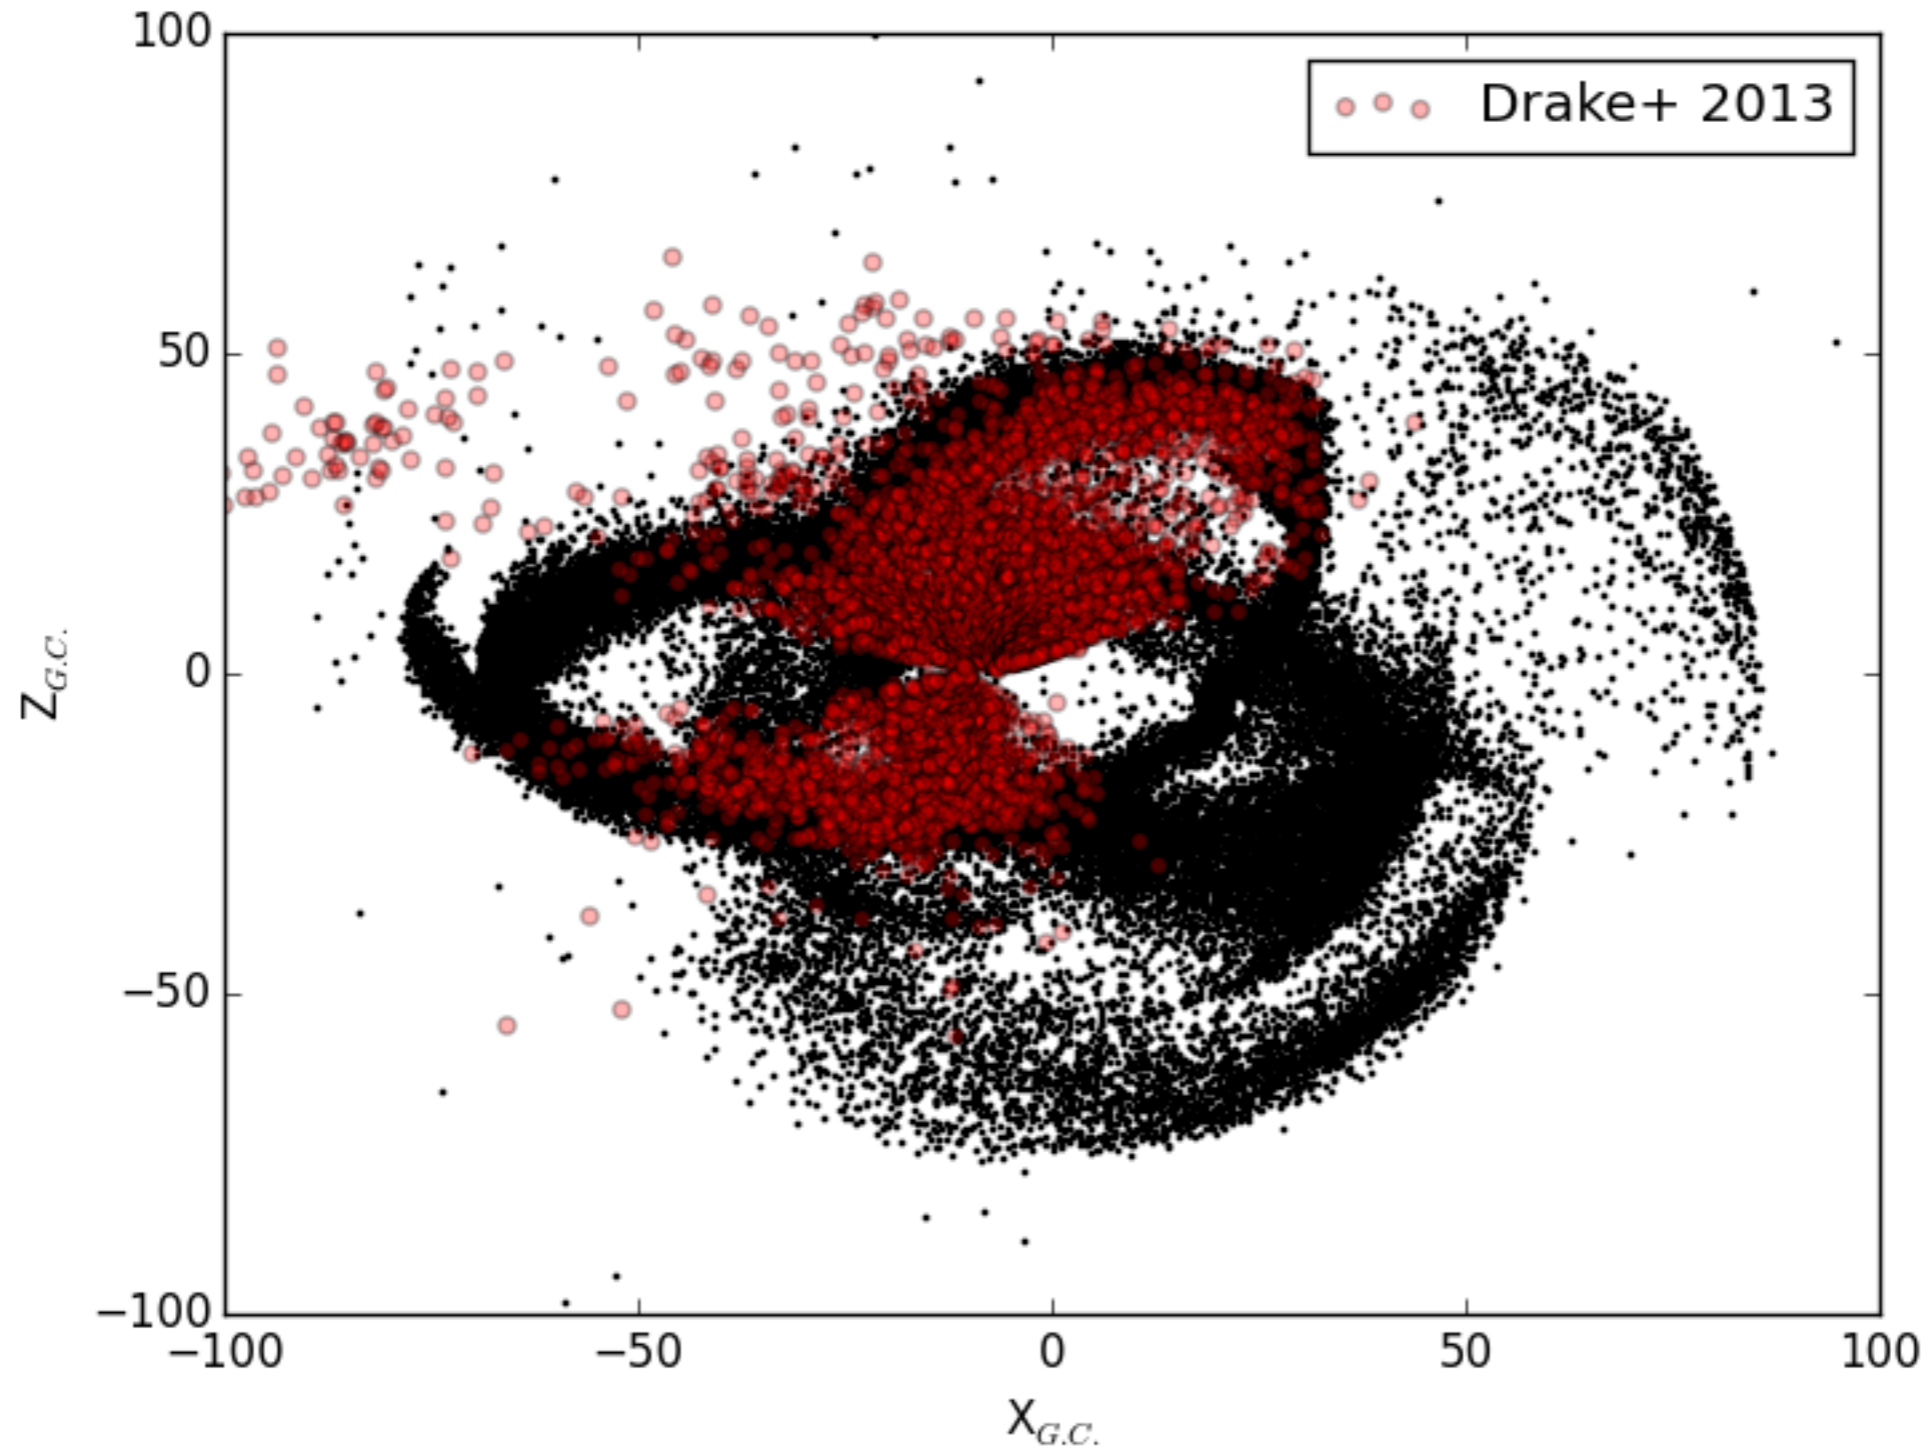

Comparison With Other Studies (Newby+ 2013)

Comparison With Other Studies (Slater+ 2013)

Comparison With Other Studies (Drake+ 2013)

Comparison With Other Studies (Huxor+ Prep)

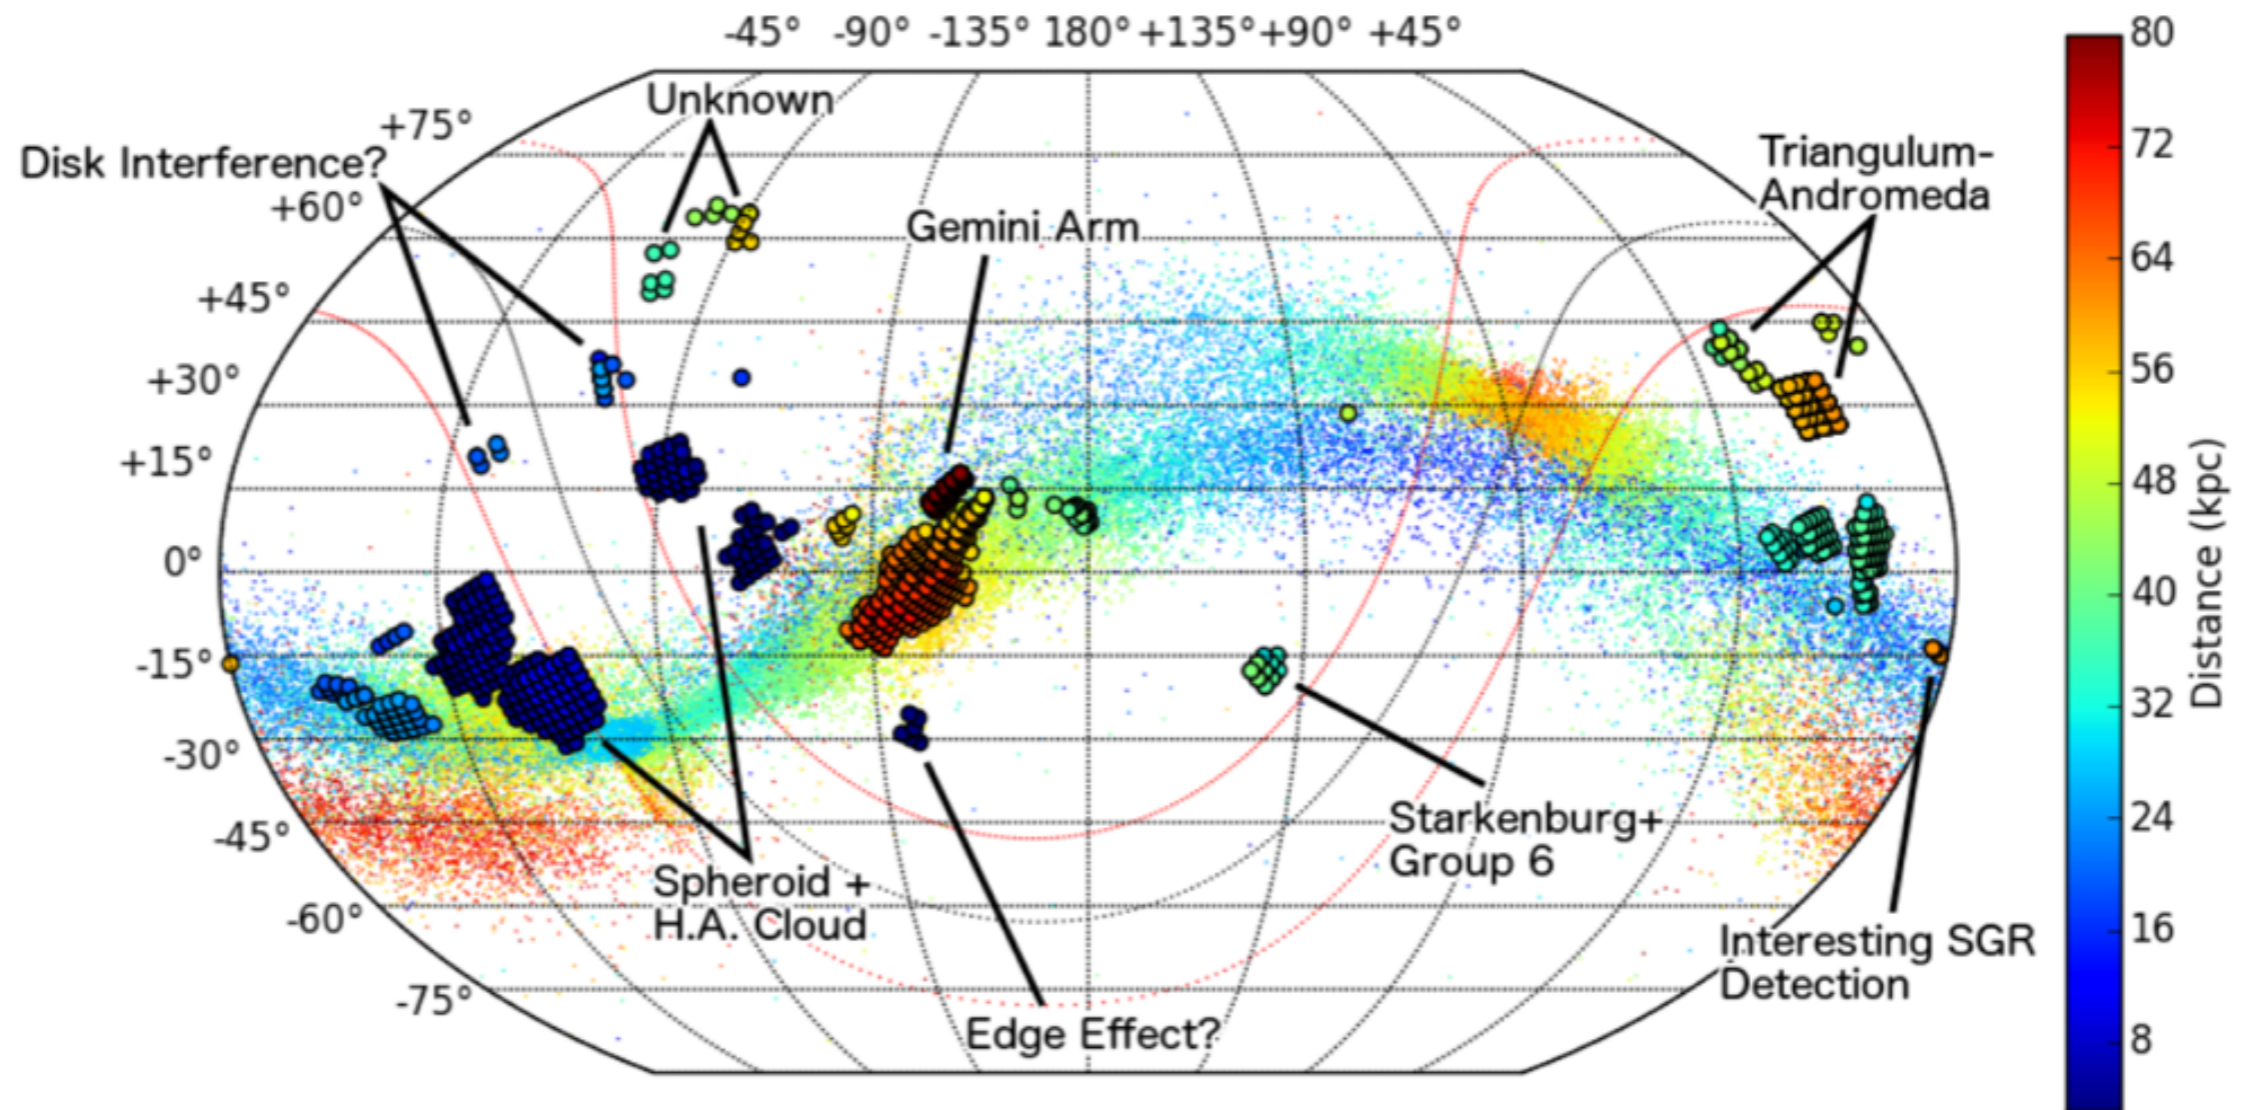

Comparison With Other Studies (This Work)

Comparison

Findings

Vickers Thesis

- See poster of Avon Huxor for this diagram in carbon stars

Supplemental Material

Search Equations

$$\text{Cube} = \Sigma(\text{stars}) \quad \forall \quad |l_{\text{star}} - l'| < 5^\circ \quad \wedge \quad |b_{\text{star}} - b'| < 5^\circ \quad \wedge \quad |r_{\text{star}} - r'| < 5\text{kpc}$$

$$\text{Pencil} = \Sigma(\text{stars}) \quad \forall \quad |l_{\text{star}} - l'| < 5^\circ \quad \wedge \quad |b_{\text{star}} - b'| < 5^\circ$$

$$\text{Ring} = \Sigma(\text{stars}) \quad \forall \quad |l_{\text{star}} - l'| > 5^\circ \quad \wedge \quad |b_{\text{star}} - b'| < 5^\circ \quad \wedge \quad |r_{\text{star}} - r'| < 5\text{kpc}$$

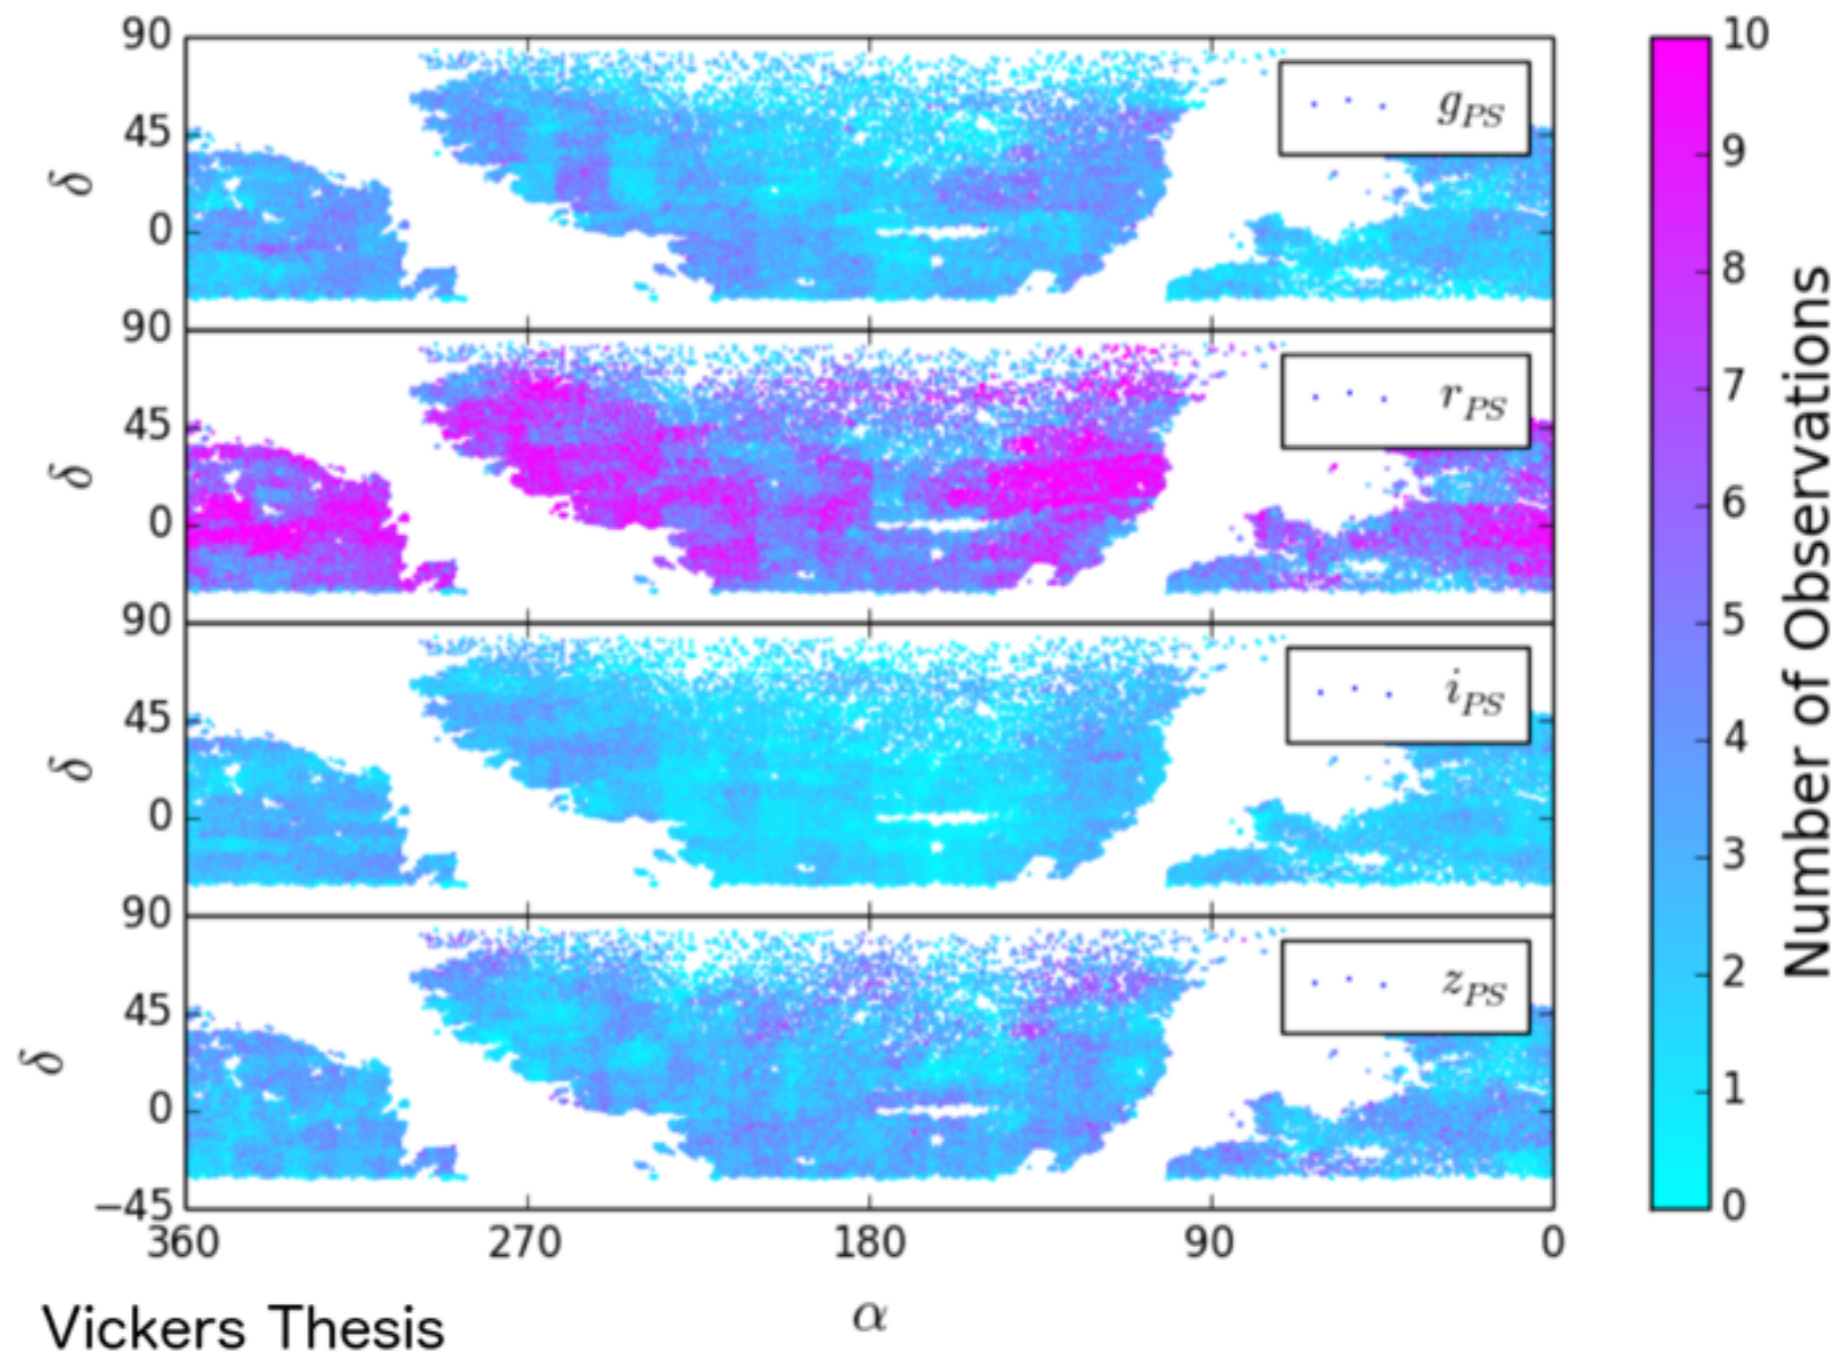

$$\text{Disk} = \Sigma(\text{stars}) \quad \forall \quad |l_{\text{star}} - l'| > 5^\circ \quad \wedge \quad |b_{\text{star}} - b'| < 5^\circ$$

$$\text{Cube Concentration} = \frac{\text{Cube}}{\text{Pencil}} \quad ; \quad \text{Field Concentration} = \frac{\text{Ring}}{\text{Disk}} \quad ; \quad \sigma = \frac{\sqrt{\text{Cube}^2 + \text{Ring}^2}}{\text{Pencil}}$$

$$\text{Degree Overdensity} = \frac{\text{Cube Concentration} - \text{Field Concentration}}{\sigma}$$

Pan-STARRS Data

- Inhomogeneous, time-resolved survey

Findings

Looser Color Selection

Tighter Color Selection

- W
