

Photometric calibration of multi-filter surveys: J-PLUS, J-PAS & *Gaia*

C. López-Sanjuan,
J. Varela, D. Cristóbal-Hornillos, H. Vázquez Ramió,
J. M. Carrasco, P. -E. Tremblay, D. D. Whitten, V. Placco,
A. Marín-Franch, A. J. Cenarro, A. Ederoclite,
and the J-PLUS collaboration

Centro de Estudio de Física del Cosmos de Aragón

ICCUB / 18th February 2020

Funding agencies :

Large-area multi-filter surveys

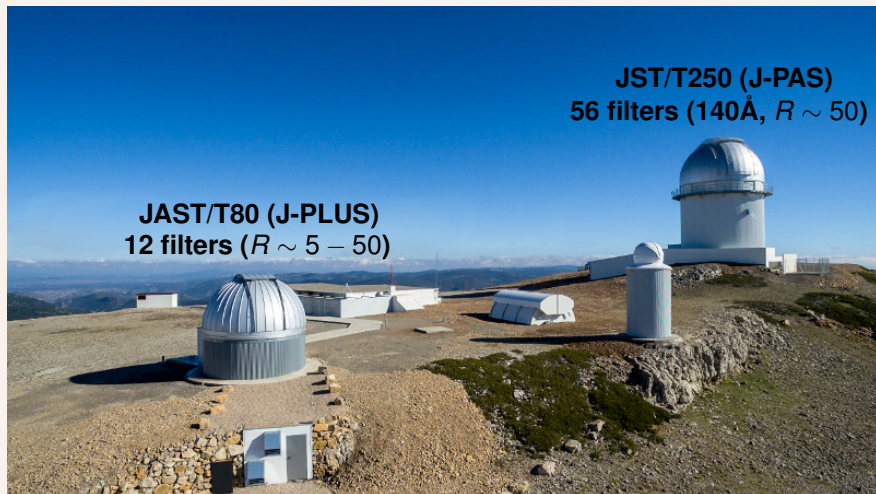

Vázquez Ramió's talk about OAJ & *Gaia* synergies this morning

Large-area multi-filter surveys

Large-area multi-filter surveys

Vázquez Ramió's talk about OAJ & *Gaia* synergies this morning

Large-area multi-filter surveys

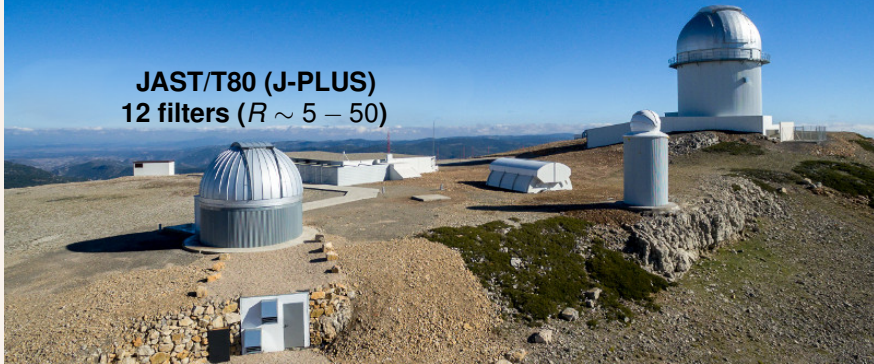

gaia

Spectrophotometry
($R \sim 30 - 100$)

JST/T250 (J-PAS)
56 filters (140\AA , $R \sim 50$)

JAST/T80 (J-PLUS)
12 filters ($R \sim 5 - 50$)

Vázquez Ramió's talk about OAJ & *Gaia* synergies this morning

Photometric calibration

Relative calibration

Ensure an homogeneous photometric solution across the surveyed area

Overlapping areas (Glazebrook+94)

Übercalibration (Padmanabhan+08)

Hypercalsibration (Finkbeiner+16)

Stellar locus regression (High+09)

Stellar colour regression (Yuan+15)

Forward global calibration (Burke+14)

Functional analytic formulation

(Weiler+20, Carrasco's talk)

Absolute calibration

Provide the physical flux scale of the observations on top of the atmosphere

White dwarfs (WDs) are the best astronomical objects to derive an absolute calibration.

All about WDs science in Torres' talk this morning.

Photometric calibration

Absolute calibration

Provide the physical flux scale of the observations on top of the atmosphere

White dwarfs (WDs) are the best astronomical objects to derive an absolute calibration.

All about WDs science
in Torres' talk this morning.

Spectro-photometric standard stars

WDs as spectro-photometric standard stars (e.g. Bohlin+95).
A significant telescope time because of the large number of filters.

Synthetic photometry with WDs

WDs models from ($T_{\text{eff}}, \log g$) as reference (Holberg & Bergeron 06).
Spectroscopy is needed to estimate these parameters.

White dwarf locus

Absolute colour calibration with the **white dwarf locus**
(López-Sanjuan et al. 2019c)

DR1 (1 022 deg², Cenarro+19)

White dwarf locus

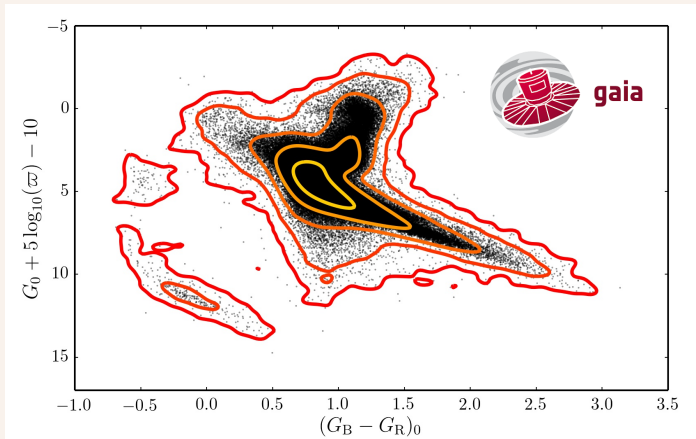

Absolute colour calibration with the **white dwarf locus**
(López-Sanjuan et al. 2019c)

DR1 (1 022 deg², Cenarro+19)

WD locus : selection

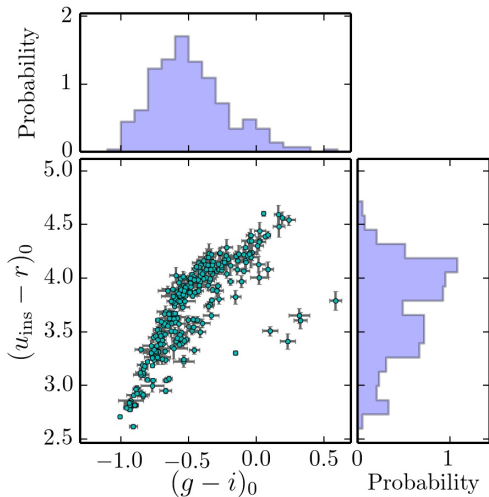

J-PLUS DR1 ($S/N > 10$) + *Gaia* ($S/N > 3$) : 496 798 sources.
We use the *Gaia* luminosity-colour diagram to select 293 WDs.

WD locus : selection

J-PLUS DR1 ($S/N > 10$) + *Gaia* ($S/N > 3$) : 496 798 sources.
We use the *Gaia* luminosity-colour diagram to select **293 WDs**.

WD locus : modelling

χ_0 are dust de-reddened magnitudes with Bayestar17 (Green+18)

gri broad-bands anchored to

$U = u_{ins} + \Delta u_{WD}$
 $\Delta u_{WD} \rightarrow$ offset to match the theoretical (Tremblay+13 and Cukanovaite+18) WD locus.

1. Remove outliers
2. Bayesian modelling

$$f_{DA} = 0.85 \pm 0.01$$

$$\log g = 8.01 \pm 0.03$$

WD locus : modelling

\mathcal{X}_0 are dust de-reddened magnitudes with Bayestar17 (Green+18)

gri broad-bands anchored to

$U = u_{ins} + \Delta u_{WD}$
 $\Delta u_{WD} \rightarrow$ offset to match the theoretical (Tremblay+13 and Cukanovaite+18) WD locus.

1. Remove outliers
2. Bayesian modelling

$$f_{DA} = 0.85 \pm 0.01$$

$$\log g = 8.01 \pm 0.03$$

WD locus : modelling

\mathcal{X}_0 are dust de-reddened magnitudes with Bayestar17 (Green+18)

gri broad-bands anchored to

$U = u_{\text{ins}} + \Delta u_{\text{WD}}$
 $\Delta u_{\text{WD}} \rightarrow$ offset to match the theoretical (Tremblay+13 and Cukanovaite+18) WD locus.

1. Remove outliers
2. Bayesian modelling
 $f_{\text{DA}} = 0.85 \pm 0.01$
 $\log g = 8.01 \pm 0.03$

WD locus : modelling

χ_0 are dust de-reddened magnitudes with Bayestar17 (Green+18)

gri broad-bands anchored to

$u = u_{\text{ins}} + \Delta u_{\text{WD}}$
 $\Delta u_{\text{WD}} \rightarrow$ offset to match the theoretical (Tremblay+13 and Cukanovaite+18) WD locus.

1. Remove outliers
2. Bayesian modelling
 - $f_{\text{DA}} = 0.85 \pm 0.01$
 - $\log g = 8.01 \pm 0.03$

WD locus : extra colour-colour plots

WD locus : testing the calibration

$$ZP_z = z_{ins} + \Delta z_{WD}$$

$$\Delta ZP_z = 0 \pm 5 \text{ mmag}$$

ZP_z from

WD locus : testing the calibration

$$ZP_z = z_{\text{ins}} + \Delta z_{\text{WD}}$$

$$\Delta ZP_z = 0 \pm 5 \text{ mmag}$$

ZP_z from

Conclusions

Gaia provides
the WD sample
to J-PLUS and J-PAS

J-PLUS provides
the WD locus technique
to J-PAS and *Gaia*

J-PAS will provide
an independent photometry
to test *Gaia* calibration

Conclusions
